

PlanetMind AI — The Operating System for Earth System Intelligence

The unified intelligence layer for decisions at planetary scale

The Billion-Dollar Opportunity

We're in the most consequential decade for planetary stewardship in human history. Yet our ability to understand and respond to Earth's interconnected systems remains fragmented across thousands of siloed data sources, incompatible models, and disconnected institutions.

The market reality: - **\$3.2T** in annual climate-related financial risk decisions made with incomplete data - **\$850B** global climate adaptation spending by 2030 (McKinsey) - **\$500B** agricultural decisions annually impacted by climate uncertainty - **\$200B** insurance industry losses from climate events (2025) - **\$150B** ESG compliance and reporting market

The critical gap: No unified intelligence layer connects satellite imagery, ocean sensors, atmospheric data, biodiversity monitoring, and economic activity into actionable insights.

PlanetMind AI is that layer.

The Vision

PlanetMind AI creates the first comprehensive Earth Operating System — a real-time, AI-native platform that synthesizes planetary-scale data into decision-grade intelligence for:

- **Governments** making infrastructure and policy decisions
- **Insurers** pricing climate risk and managing portfolios
- **Agriculture** optimizing for yield and resilience
- **Investors** assessing physical and transition risk
- **Corporations** managing supply chain climate exposure
- **Humanitarian organizations** predicting and responding to disasters

We're building the Google Maps for Earth systems — the authoritative intelligence layer everyone trusts.

How It Works

Data Fusion Engine

- 1. Satellite Intelligence Layer** - Real-time integration of 200+ satellite constellations - Sub-meter resolution imagery with hourly refresh - Multispectral analysis: thermal, SAR, hyperspectral - AI-powered change detection at global scale
- 2. Ground Truth Network** - 50M+ IoT sensors: weather stations, soil sensors, water monitors - Ocean buoy networks and underwater acoustic arrays - Seismic and volcanic monitoring systems - Crowd-sourced mobile sensor data (phones, vehicles)
- 3. Atmospheric & Climate Models** - Integration with major climate modeling centers (NOAA, ECMWF, NASA) - Real-time weather fusion with 1km resolution - Proprietary ensemble models for 1-day to 30-year forecasts - Carbon flux monitoring and verification
- 4. Biodiversity & Ecosystem Layer** - Environmental DNA (eDNA) monitoring integration - Wildlife tracking and migration pattern analysis - Vegetation health indices at parcel level - Coral reef, forest, and wetland monitoring

5. Human Activity Layer - Economic activity indicators (shipping, energy, construction) - Land use change detection - Urban heat island monitoring - Agricultural practice classification

Intelligence Products

Climate Risk Analytics - Asset-level physical risk scoring (1-100) - Scenario modeling: 1.5°C, 2°C, 3°C pathways - Transition risk assessment - Portfolio-level exposure analysis

Real-Time Earth Monitoring - Global event detection within minutes - Cascade effect prediction (drought → crop failure → migration) - Automated alerting and escalation - Historical pattern analysis

Predictive Intelligence - 90-day crop yield forecasts by region - Hurricane and typhoon trajectory refinement - Flood risk prediction at property level - Wildfire spread modeling

Verification & Compliance - Carbon credit verification (deforestation, reforestation) - ESG data validation - Regulatory compliance reporting - Greenwashing detection

Target Customers

Tier 1: Enterprise (\$500K-\$5M ACV)

Insurance & Reinsurance - Munich Re, Swiss Re, Lloyd's syndicates - Property & casualty insurers - Agricultural insurers - Pain: Catastrophe modeling based on outdated data - Value: Real-time risk pricing, portfolio optimization

Asset Managers & Banks - BlackRock, Vanguard, State Street - Infrastructure funds - Agricultural commodity traders - Pain: TCFD compliance, physical risk assessment - Value: Decision-grade climate risk data

Agricultural Conglomerates - Cargill, ADM, Bunge, Louis Dreyfus - Seed and input companies - Food & beverage CPGs - Pain: Supply chain climate exposure - Value: Predictive yield intelligence, sourcing optimization

Tier 2: Government & Multilateral (\$1M-\$20M contracts)

National Governments - Climate adaptation planning agencies - Agricultural ministries - Disaster management organizations - Defense and intelligence agencies

Multilateral Organizations - World Bank, IMF - UN agencies (FAO, WFP, UNEP) - Regional development banks

Tier 3: Mid-Market (\$50K-\$200K ACV)

Regional Insurers - Farm Bureau insurers - Regional P&C carriers - Specialty agricultural insurers

Agricultural Operations - Large farm operations - Agribusiness cooperatives - Precision agriculture companies

Business Model

SaaS Platform Tiers

Explorer — \$50K/year - Regional focus (1 continent) - Standard resolution data - 5 user seats - API access: 100K calls/month - Community support

Professional — \$200K/year - Global coverage - Enhanced resolution - 25 user seats - API access: 1M calls/month - Custom dashboards - Dedicated CSM

Enterprise — \$500K-\$2M/year - Full resolution all data layers - Unlimited seats - Custom model integration
- On-premise deployment option - Dedicated engineering support - SLA guarantees

Sovereign — \$5M-\$20M/year - Government-grade security - National-level custom deployment - Classified data integration - Joint model development - Resident engineering team

Data Products (Transactional)

- **Climate Risk Reports:** \$10K-\$100K per asset portfolio
- **Carbon Verification:** \$1-\$5 per credit verified
- **Historical Analysis:** \$25K-\$500K per study
- **Custom Intelligence Briefs:** \$50K-\$250K

API Economy

- Per-call pricing for developers: \$0.001-\$0.10 per query
- Bulk data licensing: \$100K-\$1M annually
- Model training data access: Revenue share

Financial Projections

Year	ARR	Customers	Employees	Key Milestone
2026	\$3M	15	45	Platform launch, first enterprise customers
2027	\$18M	60	120	Government contracts, Series B
2028	\$65M	180	280	International expansion, API ecosystem
2029	\$150M	400	500	Insurance industry standard, Series C
2030	\$350M	900	850	IPO-ready, global platform

Path to \$1B ARR by 2032: - 2,000+ enterprise customers globally - Government contracts in 50+ countries - API ecosystem with 10,000+ developers - Dominant position in climate risk intelligence

Competitive Landscape

Current Players (Fragmented)

Satellite Analytics - Planet Labs, Maxar, Spire: Imagery without synthesis - Orbital Insight: Limited to specific use cases - Gap: None offer comprehensive Earth system intelligence

Climate Risk - Jupiter Intelligence: Physical risk modeling - Moody's/Four Twenty Seven: ESG ratings focus - Gap: Lack real-time synthesis, limited to risk scoring

Agricultural Intelligence - Gro Intelligence: Commodity analytics - Descartes Labs: Platform, limited coverage - Gap: Siloed from broader Earth systems

Carbon Verification - Pachama, NCX: Carbon-specific - Gap: Point solutions, not integrated platform

PlanetMind Advantage

Comprehensive Synthesis - Only platform integrating ALL major Earth data sources - Real-time fusion, not batch processing - AI-native architecture built for scale

Decision-Grade Intelligence - Beyond data visualization — actionable recommendations - Calibrated uncertainty quantification - Customizable to specific decision contexts

Network Effects - Customer data improves models - API ecosystem creates lock-in - Standard-setting creates moat

Technical Architecture

Core Platform

Technology Stack

Infrastructure - Multi-cloud (AWS, GCP, Azure) for redundancy - Edge compute for real-time processing - Object storage: 50+ PB capacity - GPU clusters for ML inference

Data Processing - Apache Spark for batch processing - Apache Kafka for streaming - Custom satellite imagery pipeline - Temporal database for time-series

AI/ML - Foundation models for Earth observation - Physics-informed neural networks - Ensemble prediction systems - Automated model retraining

Security - FedRAMP High authorization path - SOC 2 Type II certified - Zero-trust architecture - End-to-end encryption

Go-to-Market Strategy

Phase 1: Enterprise Beachhead (Months 1-12)

Target: Insurance and reinsurance industry

Why insurance first: - Desperate need for better catastrophe modeling - High willingness to pay (\$1M+ deals) - Concentrated buyer base (~100 key accounts) - Regulatory pressure (climate disclosure)

Launch motion: - 3 design partners: Munich Re, Swiss Re, AXA - Pilot with 2024-2025 catastrophe hindcast validation - Insurance industry conference presence - Thought leadership on climate risk pricing

Phase 2: Horizontal Expansion (Months 12-24)

Expand to: - Asset managers and banks (TCFD compliance) - Agricultural conglomerates (supply chain risk) - Government agencies (climate adaptation)

Key activities: - Launch self-serve Explorer tier - API ecosystem development - Regional expansion (Europe, Asia) - Strategic partnerships (Bloomberg, S&P)

Phase 3: Platform Dominance (Months 24-36)

Become the standard: - API ecosystem with 1,000+ developers - Integration partnerships (Salesforce, SAP) - Government contracts in 20+ countries - Academic and research partnerships

Team Requirements

Founding Team (Already Identified)

CEO — Earth science + enterprise software background - Former VP at Planet Labs or Orbital Insight - Deep relationships in insurance and finance - Passion for climate action

CTO — Large-scale data systems expert - Former Google Earth Engine or NASA JPL - Built petabyte-scale geospatial systems - AI/ML expertise

Chief Scientist — Climate science authority - PhD in Earth science or related field - Published researcher on climate systems - Government/multilateral relationships

Key Hires (Year 1)

- **VP Engineering:** Satellite data pipeline expert
- **VP Sales:** Insurance/finance enterprise sales
- **VP Data Partnerships:** Satellite and sensor deals
- **Head of Product:** Geospatial platform experience
- **Head of Government:** Public sector sales

Build Plan

Quarter	Headcount	Key Functions
Q1 2026	15	Core engineering, data science, first sales
Q2 2026	25	Platform build-out, design partners
Q3 2026	35	Sales expansion, customer success
Q4 2026	45	International, government vertical

Funding Strategy

Seed Round: \$8M (Target: Q1 2026)

Use of Funds: - Core platform development: \$4M - Data partnership deposits: \$2M - Team hiring: \$1.5M - Operations: \$0.5M

Target Investors: - Climate-focused VCs: Congruent, Lowercarbon, Prelude - Deep tech: Lux Capital, DCVC - Strategic: In-Q-Tel, Palantir Foundry Fund

Series A: \$35M (Target: Q4 2026)

Milestones for A: - \$2M+ ARR - 5+ enterprise customers - Successful catastrophe prediction validation - Government pilot in progress

Target Investors: - Tier 1 climate: Breakthrough Energy Ventures - Enterprise SaaS: Bessemer, Battery - Crossover: General Atlantic, Tiger

Series B: \$100M (Target: Q4 2027)

Milestones for B: - \$15M+ ARR - Insurance industry standard positioning - Government contracts in 3+ countries - API ecosystem launched

Risks & Mitigations

Risk	Probability	Impact	Mitigation
Data access costs	High	Medium	Pre-negotiate bulk licensing; build own sensor network
Satellite company competition	Medium	High	Focus on synthesis layer, not imagery; partnership approach
Long enterprise sales cycles	High	Medium	Government design partners; pilot-first model
Technical complexity	Medium	High	Hire deep expertise; partner with NASA/NOAA
Climate politics	Low	Medium	Position as risk intelligence, not advocacy
Talent competition	Medium	Medium	Remote-first; mission-driven culture; strong equity

Why Now

1. Data Abundance

More Earth observation satellites launched in 2024-2025 than previous 50 years combined. IoT sensor costs down 10x. Data exists — synthesis doesn't.

2. AI Capability

Foundation models can now process and synthesize multi-modal data at scale. What required building NASA took decades, we can now build in 24 months.

3. Regulatory Pressure

TCFD, EU CSRD, SEC climate disclosure rules creating mandatory demand for climate risk data.

4. Climate Reality

Every company, government, and institution now must make climate-informed decisions. This isn't optional anymore.

5. Capital Availability

\$1T+ committed to climate tech. Investors actively seeking platforms, not point solutions.

The PlanetMind Thesis

Every major decision on Earth will be informed by planetary intelligence. We're building that intelligence layer.

The 20th century's defining infrastructure was the highway system, the power grid, and the internet. The 21st century's will be Earth system intelligence.

PlanetMind AI isn't just another climate tech company. We're building the operating system for planetary decision-making — a platform that will become as essential as GPS or weather forecasts.

The companies that capture this layer will be worth hundreds of billions. We intend to be the definitive winner.

"In God we trust. All others must bring data." — W. Edwards Deming
For Earth, we're building that data layer.
